# Teaching Statement

Dayanara M. Diaz Vargas

October 2026

Every student brings different strengths to a classroom. Some develop their ideas through discussion, while others benefit from working independently, and others by asking questions and talking out ideas with others. For those who are less comfortable speaking in front of their peers, participating can be challenging, and I recognize this. My teaching responds to these differences in learning styles and personality, by offering multiple ways to participate and demonstrate understanding of the course's material. As such, I have worked to make my recitations accessible to students who develop ideas through independent study by constantly sharing reading materials, homeworks and practice exercises. I also pride myself in making my classroom an environment where any idea is safely welcomed into the discussion, cultivating students' ability to confidently participate in class and work in groups with their peers.

## Teaching Experience

During my Ph.D., I have taught in six undergraduate courses (two of them in more than one term), leading recitations in one and serving as a teaching assistant (TA) in the other five. At mid-semester in Fall 2026, I ran an anonymous survey in my four recitation sections. Eighteen of the 25 students who answered rated my overall teaching effectiveness 5 out of 5, and the mean rating was 4.64. All 25 agreed or strongly agreed that they feel comfortable asking questions in recitation. You may also refer to my website, which lists the instructor of record for each course and collects anonymous feedback from my recitation students.

ECON 1115 *Principles of Macroeconomics*, recitation ECON 1125 (Summer 2024–Fall 2026): This course is Northeastern's introduction to macroeconomics, a 400-student lecture paired with small-group recitations that carry 30 percent of the course grade. My responsibilities include leading up to four weekly 60-minute recitation sections per term, where I design and teach the discussion; supervising each group's semester-long case study research projects; holding office hours; and grading problem sets, discussion boards, and exams. In recitations, each idea reaches students in more than one way. I write the equation on the board while students look up a definition or a fact on their laptops, we match what they find to the equation, and students then work through it in randomly assigned groups of three. I then bring up World Bank or FRED data and ask students to interpret the indicators against the equation or relevant research studies. For example, when we discussed how imports affect manufacturing jobs at home, I wrote Autor, Dorn, and Hanson's work on the China shock on the board, and students took a new interest in the class. Since some students feel uncomfortable at the center of attention, I never call on anyone at random; I ask open questions and work through the answers with the volunteers. Asked in my mid-semester survey what I should keep doing, one student wrote, *"Letting us raise our hands instead of cold calling."* To get students talking without cold calling, I use their names in my examples, such as John's corporation versus Eva's firm. I also open the conversation with questions that seem unrelated to the topic. For example, I ask, "Who has a savings account? Raise your hand!" Then I ask a student who raised a hand, "Why?" and guide the answer toward how interest rates affect savers and borrowers. The survey's most common request, from five of the 25 students, was for recitations that work differently from the lecture. That request led me to incorporate more problem sets and discuss them on the board, instead of dictating concepts.

ECON 2316 *Microeconomic Theory* (Spring 2023, Spring 2026): This course is the department's calculus-based intermediate microeconomics course; it typically has 35 students. My responsibilities included grading problem sets, proctoring exams, and holding office hours.

ECON 2350 *Statistics for Economists* (Summer 2025): This course teaches the statistical tools that economists use to analyze data; it had 25 students. My responsibilities included grading its eight take-home data assignments and holding office hours.

ECON 1260 *Contested Economic Issues* (Summer 2024): This course is an introductory survey of the economic debates the United States faces as a nation; it had 24 students. My responsibilities included grading assignments and exams and holding office hours.

ECON 2560 *Applied Econometrics* (Fall 2023, two sections): This course is the department's undergraduate course in applied regression analysis; it had two sections of 30 students each. My responsibilities included grading its seven problem sets, proctoring its two midterms and final exam, and holding office hours.

INTL 3520 *Global Political Economy* (Spring 2023): This course is an International Affairs course on development policy in the global economy; it had 17 students. As one of its two TAs, I proctored the midterm, graded the midterm and the final exam, and held office hours.

**Future Courses**

In every course, I would keep the variety of graded work I have handled as a TA, including exams, problem sets, discussion boards, group projects, and presentations, so that students have several ways to show what they understand. The list below describes the field courses I am prepared to teach and design; I am also prepared to teach undergraduate principles courses as well as courses in all levels of microeconomics theory.

(1) *Health economics*: upper-level undergraduate or graduate. This course would follow eleven modules: the value of health insurance; risk selection and health insurance markets; benefit design and moral hazard; health insurance and medical debt; physician decision making and medical productivity; the industrial organization of pharmaceutical markets; medical innovation; mental health; addiction and the opioid crisis; long-term care; and health equity and fairness, with a focus on field experiments. The graduate course would center on one research paper per class, and each student will be expected to open the class with a summary presentation of that paper. Students will be graded on a midterm exam, a final exam, and a group project that exploits the Affordable Care Act's Medicaid expansion.

(2) *Labor economics*: upper-level undergraduate or graduate. This course would follow six modules: place-based policies, wage inequality, neighborhood effects, migration, unemployment insurance, and social insurance and labor supply. For the graduate course, each class would center on one research paper that estimates the labor market effects of current policies, estimated with causal inference methods, such as difference-in-differences, instrumental variables, or regression discontinuity. Students would take two assignments, a midterm, final exam, and a group project focused on SNAP's work requirements.

(3) *Industrial organization*: undergraduate or graduate. I would cover monopoly, oligopoly and collusion, product differentiation, entry, vertical relationships, pricing, and innovation. Students would complete two problem sets, a midterm, a final exam, and a group project. The undergraduate version would use introductory calculus, while the graduate version would incorporate multivariable calculus optimization, game theory, and discussions of research papers. The group project would be a retrospective study of the efficiency of antitrust remedies in a merger the Federal Trade Commission recently contested.
